Computation Types

Built-in Funcon `computation-types : types`

For any value type T , the term $\Rightarrow T$ is the type of computations that compute values of type T whenever they terminate normally.

For any subtypes S , T of `values`, $S \Rightarrow T$ is the type of computations that compute values of type T whenever they terminate normally, and either do not refer at all to the `given` entity, or require the `given` entity to have type S .
